## Homework \#5

(Due on 2 December 2010)

Given the following network, use Dijkstra's algorithm to find the least cost paths from node $u$. Please provide a table showing the steps of the algorithm, a graph showing the resulting shortest-path tree from $u$ and the final forwarding table of u.

3

| Step | $\mathbf{N}^{\prime}$ | $\mathbf{D}(\mathbf{v}), \mathbf{p}(\mathbf{v})$ | $\mathbf{D}(\mathbf{w}), \mathbf{p}(\mathbf{w})$ | $\mathbf{D}(\mathbf{x}), \mathbf{p}(\mathbf{x})$ | $\mathbf{D}(\mathbf{y}), \mathbf{p}(\mathbf{y})$ | $\mathbf{D}(\mathbf{z}), \mathbf{p}(\mathbf{z})$ |

Given the following network, use the Distance Vector algorithm to find the least cost paths for all nodes. Fill the provided tables and indicate with arrows between the tables when a node sends a distance vector to another node.

Compare Link State routing algorithms to Distance Vector algorithms in terms of scalability and robustness.

Explain the count-to-infinity problem using a simple example. How can this problem be avoided?

How are routing policies used in BGP. Give one example.

What is the difference between Intra-AS and Inter-AS routing? Why are different routing protocols needed for each? Name one example for each category.
