

# Computer Networks

Jan 31st, 2013

# Announcements

- Final exam: Thursday 07.02.2013
  - 10:00 -12:00 : MN06
- Language: English + German, answers possible in both languages
- No additional resources (calculator etc.) allowed. Just bring pens ;).

# Practical Course

- Practical Course Networking Lab (BSc)
- <https://wiki.net.informatik.uni-goettingen.de/wiki/Teaching>
- B.Inf.802/803/804: Fachpraktikum I/II/III (180h, 6 ECTS)
- Block course during the semester break
- 2 weeks, groups of 2 persons
- Send the TAs an email if you are interested

# Research at NET group

- *We always have topics for Bachelor/Master thesis interests as well as for student projects*
- Current research focuses:
  - Social Networks (Measurements, Analysis, Security)
    - E.g.: How does information propagate through a social network? Or: How can we build decentralized social networks? Or: How secure are social networks?
    - Also some cloud networking aspects
- Cloud Computing
- Content-Centric-Networking
  - What if we route packets based on names instead of addresses?

# Research at NET group

- If you are interested, send an email to
  - Prof. Fu ([fu@cs.uni-goettingen.de](mailto:fu@cs.uni-goettingen.de))
  - David Koll ([koll@cs.uni-goettingen.de](mailto:koll@cs.uni-goettingen.de))

# Secure E-Mail

Alice:

- generates random *symmetric* private key,  $K_S$ .
- encrypts message with  $K_S$  (for efficiency)
- also encrypts  $K_S$  with Bob's public key.
- sends both  $K_S(m)$  and  $K_B^+(K_S)$  to Bob.

Bob: uses his private key to decrypt and recover  $K_S$

- uses  $K_S$  to decrypt  $K_S(m)$  to recover  $m$

# Why symmetric keys?

- Why is a symmetric key used in most protocols to encrypt a data payload (the message etc.), even if a public/private key infrastructure exists?
- Public/Private keying more costly
- Minimal use of public/private key minimizes the key exposure
  - Symmetric key can be generated each time on the fly and is therefore always fresh
  - Public/Private key is always the same. Encrypting large amounts of data could compromise the key... (although no efficient algorithm is known yet)

# PGP E-Mail signature

```
---BEGIN PGP SIGNED MESSAGE---
```

```
Hash: SHA1
```

```
Bob: My husband is out of town  
tonight. Passionately yours,  
Alice
```

```
---BEGIN PGP SIGNATURE---
```

```
Version: PGP 5.0
```

```
Charset: noconv
```

```
yhHJRHhGJGhgg/12EpJ+1o8gE4vB3mqJ
```

```
hFEvZP9t6n7G6m5Gw2
```

```
---END PGP SIGNATURE---
```

Used crypto hash

Message m that is hashed with SHA1

Real signature: This is the hash of the message ( $H(m)$ ) encrypted with Alice's private key.

Verification: Bob decrypts the PGP signature and obtains  $H(m)$ . Additionally he computes  $H(m)$  for the message himself and computes it with the  $H(m)$  Alice computed.

# SSL

- What are the three main phases of SSL?
  - 1. Handshake (TCP connection, authentication + master secret generation)
  - 2. Key derivation
  - 3. Data transfer
- On what layer does SSL reside and why is that advantageous?
  - provides transport layer security to any TCP-based application using SSL services.

TCP enhanced with SSL

# IPsec

- Please sketch one typical scenario, where IPsec is used today.
  - VPN gateway at company or university. E.g. 134.76.22.1 is the VPN Gateway for the GWDG
  - Note: IPSec works on IP layer (SSL: above TCP)
- What are the two main protocols used in IPsec and what is their primary difference with respect to security properties?
  - Authentication Header (AH): Ensures authentication and data integrity. No encryption!
  - Encapsulated Security Payload (ESP): Ensures authentication, data integrity and encryption.

# 802.11i

- Should ensure better protection than WEP
  - WPA is a subset of 802.11i
- Who is handling the authentication information in an 802.11i scenario?
  - Using TLS-EAP (Extensible Authentication Protocol over Transport Layer Security) to contact an AAA (Authentication, Authorization, Accounting) Server

# Firewalls

- What is the purpose of a firewall and what are filter rules?
  - Isolation of own network from internet!

# Filter rules

- The firewall can be configured to only let certain packets pass. An administrator might be interested in setting up rules like:
  - No telnet connections to hosts behind the FW
  - Prevent outside machines to connect to inside machines, but still inside machines can connect to outsiders
  - Prevent web radios
  - Many more...

# Thank you

Any questions?
