Homework #5

(Due on November 24th 2016)

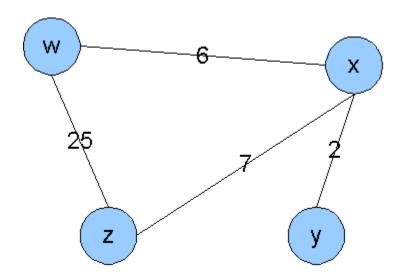

Q1. Given the following network, use Dijkstra's algorithm to find the least cost paths from node u. Please provide a table showing the steps of the algorithm, a graph showing the resulting shortest-path tree from u and the final forwarding table of u.

Step	N'	D(v), p(v)	D (w), p(w)	D(x), p(x)	D (y), p(y)	D(z), p(z)

Resulting shortest-path tree V W Resulting forwarding table in u Destination Link Z V

Q2. Given the following network, use the Distance Vector algorithm to find the least cost paths for all nodes. Fill the provided tables and indicate with arrows between the tables when a node sends a distance vector to another node.

- Q3. Compare Link State routing algorithms to Distance Vector algorithms in terms of scalability and robustness.
- Q4. Explain the count-to-infinity problem using a simple example. How can this problem be avoided?
- Q5. How are routing policies used in BGP. Give one example.
- Q6. What is the difference between Intra-AS and Inter-AS routing? Why are different routing protocols needed for each? Name one example for each category.
