#### **Network Layer – Part II**

Lecturer: Prof. Xiaoming Fu Assistant: Yachao Shao (MSc), Fabian Wölk (MSc)

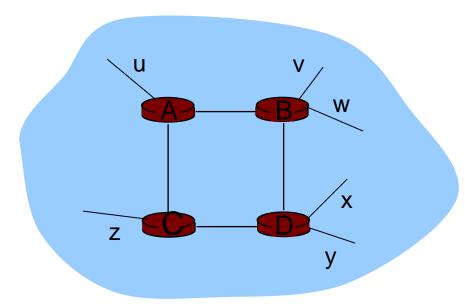

#### **Network Layer II**

- 4.5 Routing protocols
  - Routing Information Protocol (RIP)
  - Open Shortest Path First (OSPF)
  - Border Gateway Protocol (BGP)
- 4.6 Multicast
  - Broadcast routing
  - Multicast routing
  - Multicast routing protocols
- 4.7 Mobility
  - What is Mobility?
  - Network layer mobility concepts and principles
  - Mobile IP

### Routing Information Protocol (RIP)

- distance vector algorithm
- included in BSD-UNIX Distribution in 1982
- distance metric: # of hops (max = 15 hops)

From router A to subnets:

destination	<u>hops</u>
u	1
V	2
W	2
Х	3
У	3
Z	2

#### **Network Layer II**

- 4.5 Routing protocols
  - Routing Information Protocol (RIP)
  - Open Shortest Path First (OSPF)
  - Border Gateway Protocol (BGP)
- 4.6 Multicast
  - Broadcast routing
  - Multicast routing
  - Multicast routing protocols
- 4.7 Mobility
  - What is Mobility?
  - Network layer mobility concepts and principles
  - Mobile IP

# Open Shortest Path First (OSPF)

- o "open": publicly available
- o uses Link State algorithm
  - LS packet dissemination
  - topology map at each node
  - route computation using Dijkstra's algorithm
- OSPF advertisement carries one entry per neighbor router
- advertisements disseminated to entire AS (via flooding)
  - carried in OSPF messages directly over IP (rather than TCP or UDP
     Network Layer

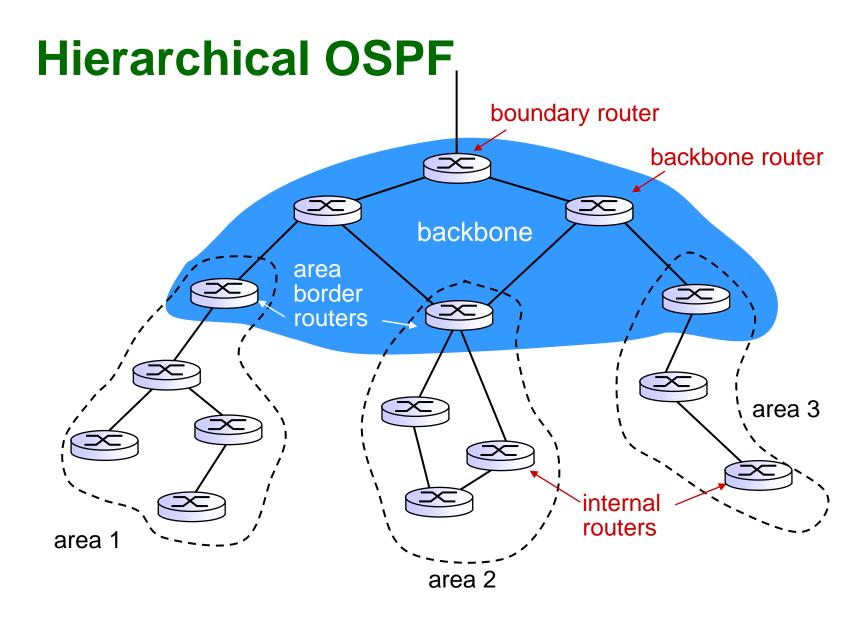

4 - 5

### OSPF "advanced" features (not in RIP)

- Security: all OSPF messages authenticated (to prevent malicious intrusion)
- multiple same-cost paths allowed (only one path in RIP)
- for each link, multiple cost metrics for different TOS (e.g., satellite link cost set low for best effort ToS; high for real-time ToS)
- Integrated uni- and multicast support:
  - Multicast OSPF (MOSPF) uses same topology data base as OSPF
- Hierarchical OSPF in large domains.

#### **Hierarchical OSPF**

- two-level hierarchy: local area, backbone.
  - $_{\circ}$  Link-state advertisements only in area
  - each node has detailed area topology; only know direction (shortest path) to nets in other areas.
- area border routers: "summarize" distances to nets in own area, advertise to other Area Border routers.
- backbone routers: run OSPF routing limited to backbone.
- boundary routers: connect to other AS's.

#### **Network Layer II**

- 4.5 Routing protocols
  - Routing Information Protocol (RIP)
  - Open Shortest Path First (OSPF)
  - Border Gateway Protocol (BGP)
- 4.6 Multicast
  - Broadcast routing
  - Multicast routing
  - Multicast routing protocols
- 4.7 Mobility
  - What is Mobility?
  - Network layer mobility concepts and principles
  - Mobile IP

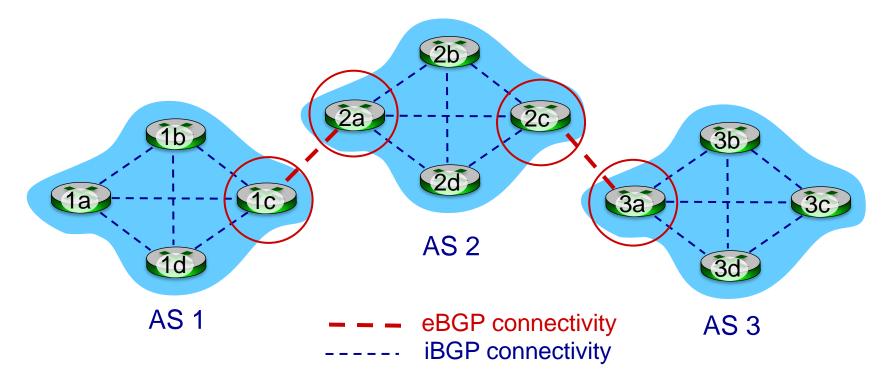

#### Inter-AS routing: BGP

- BGP (Border Gateway Protocol): the de facto standard
- BGP provides each AS means to:
  - eBGP: obtain subnet reachability information from neighboring ASes
  - iBGP: propagate reachability information to all ASinternal routers.
  - determine "good" routes to other networks based on reachability information and *policy*
- allows subnet to advertise its existence to rest of Internet: "I am here"

#### eBGP, iBGP connections

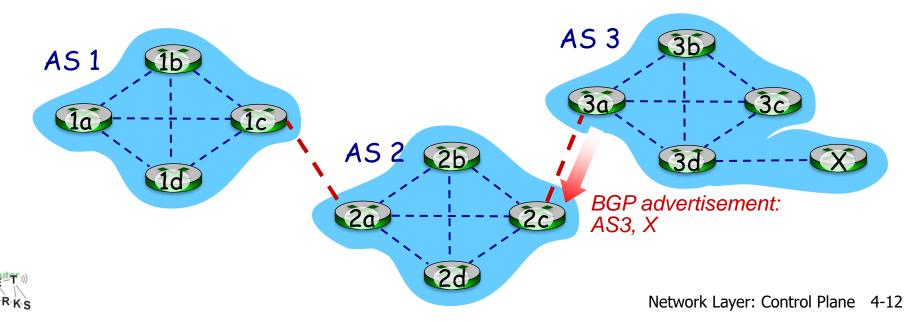

gateway routers run both eBGP and iBGP protools

#### **BGP** basics

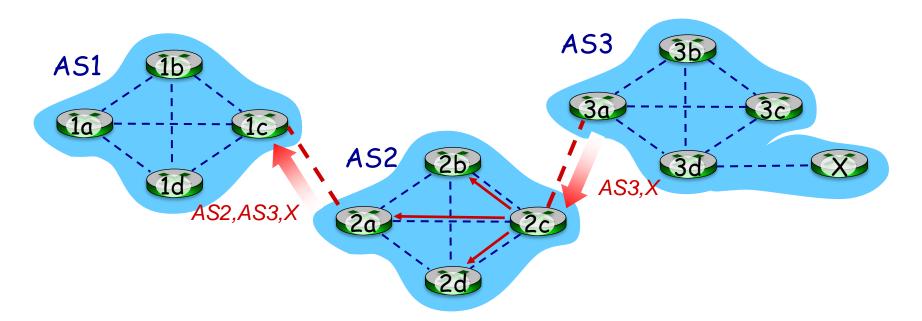

- BGP session: two BGP routers ("peers") exchange BGP messages over semi-permanent TCP connection:
  - advertising paths to different destination network prefixes (BGP is a "path vector" protocol)
- when AS3 gateway router 3a advertises path AS3,X to AS2 gateway router 2c:
  - AS3 promises to AS2 it will forward datagrams towards X

#### Path attributes and BGP routes

- $\circ$  advertised prefix includes BGP attributes
  - o prefix + attributes = "route"
- two important attributes:
  - AS-PATH: list of ASes through which prefix advertisement has passed
  - NEXT-HOP: indicates specific internal-AS router to nexthop AS
- Policy-based routing:
  - gateway receiving route advertisement uses *import policy* to accept/decline path (e.g., never route through AS Y).
  - AS policy also determines whether to *advertise* path to other other neighboring ASes

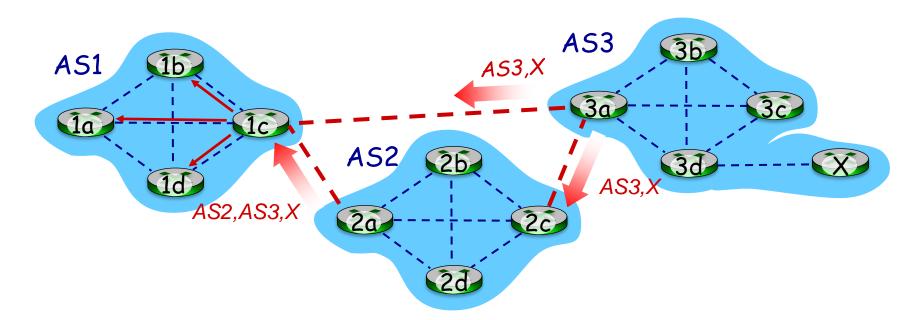

#### **BGP path advertisement**

- AS2 router 2c receives path advertisement AS3,X (via eBGP) from AS3 router 3a
- Based on AS2 policy, AS2 router 2c accepts path AS3,X, propagates (via iBGP) to all AS2 routers
- Based on AS2 policy, AS2 router 2a advertises (via eBGP) path AS2, AS3, X to AS1 router 1c

#### **BGP path advertisement**

gateway router may learn about multiple paths to destination:

- AS1 gateway router 1C learns path AS2,AS3,X from 2a
- AS1 gateway router 1C learns path AS3,X from 3a
- Based on policy, AS1 gateway router 1C chooses path AS3, X, and advertises path within AS1 via iBGP

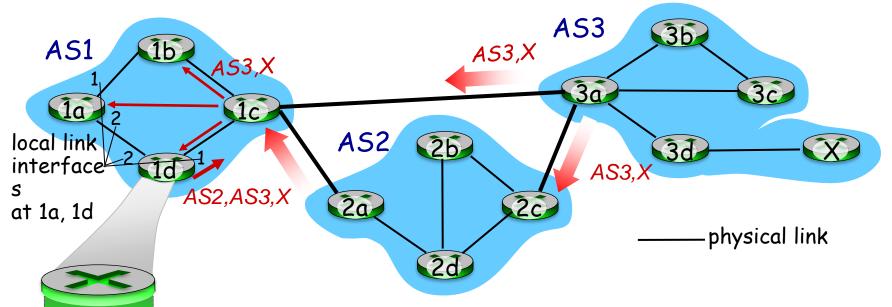

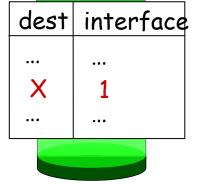

- BGP messages exchanged between peers over TCP connection
- BGP messages:
  - OPEN: opens TCP connection to remote BGP peer and authenticates sending BGP peer
  - UPDATE: advertises new path (or withdraws old)
  - KEEPALIVE: keeps connection alive in absence of UPDATES; also ACKs OPEN request
  - NOTIFICATION: reports errors in previous msg; also used to close connection

#### BGP, OSPF, forwarding table entries

Q: how does router set forwarding table entry to distant prefix?

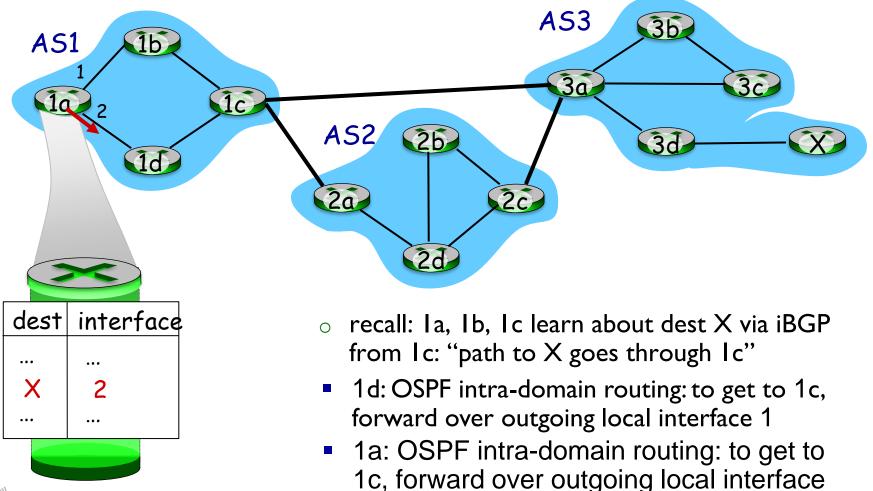

- recall: 1a, 1b, 1c learn about dest X via iBGP from 1c: "path to X goes through 1c"
- 1d: OSPF intra-domain routing: to get to 1c, forward over outgoing local interface 1

## BGP, OSPF, forwarding table entries

Q: how does router set forwarding table entry to distant prefix?

2

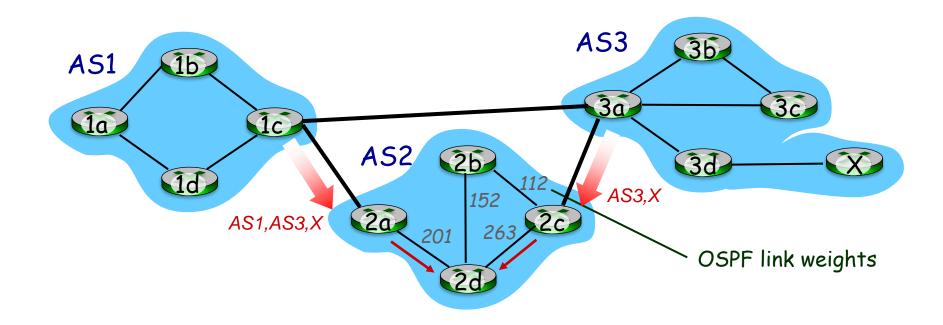

#### **BGP route selection**

- router may learn about more than one route to destination AS, selects route based on:
  - 1. local preference value attribute: policy decision
  - 2. shortest AS-PATH
  - 3. closest NEXT-HOP router: hot potato routing
  - 4. additional criteria

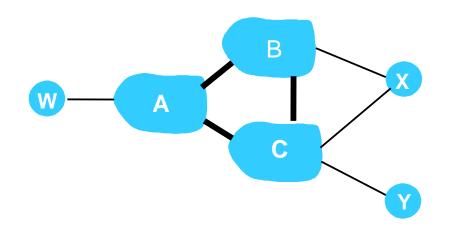

#### **Hot Potato Routing**

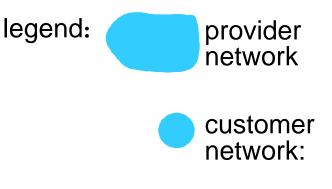

- 2d learns (via iBGP) it can route to X via 2a or 2c
- hot potato routing: choose local gateway that has least intra-domain cost (e.g., 2d chooses 2a, even though more AS hops to X): don't worry about inter-domain cost!

#### **BGP routing policy**

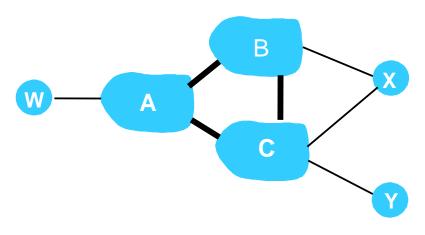

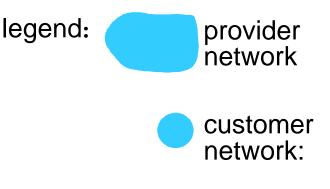

- A,B,C are provider networks
- X,W,Y are customer networks
- X is dual-homed: attached to two networks
  - $_{\circ}~$  X does not want to route from B via X to C
  - .. so X will not advertise to B a route to C

#### **BGP routing policy (2)**

- A advertises path AW to B
- B advertises path BAW to X
- Should B advertise path BAW to C?
  - No way! B gets no "revenue" for routing CBAW since neither W nor C are B's customers
  - B wants to force C to route to w via A
  - B wants to route only to/from its customers!

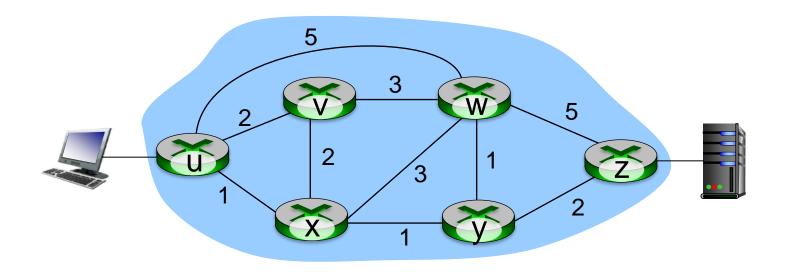

### Why different Intra- and Inter-AS routing?

#### • Policy

- Inter-AS: admin wants control over how its traffic routed, who routes through its net.
- Intra-AS: single admin, so no policy decisions needed
- Scale
  - hierarchical routing saves table size, reduced update traffic
- Performance
  - Intra-AS: can focus on performance
  - Inter-AS: policy may dominate over performance

## Traffic engineering: difficult traditional routing

<u>Q</u>: what if network operator wants u-to-z traffic to flow along *uvw*z, x-to-z traffic to flow *xwyz*?

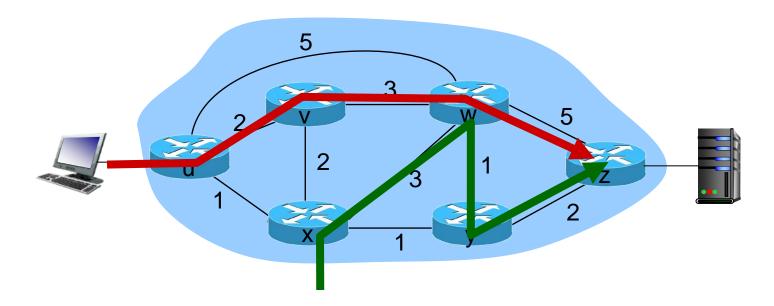

<u>A:</u> need to define link weights so traffic routing algorithm computes routes accordingly (or need a new routing algorithm)!

Link weights are only control "knobs": wrong!

#### Networking 401

#### **Traffic engineering: difficult**

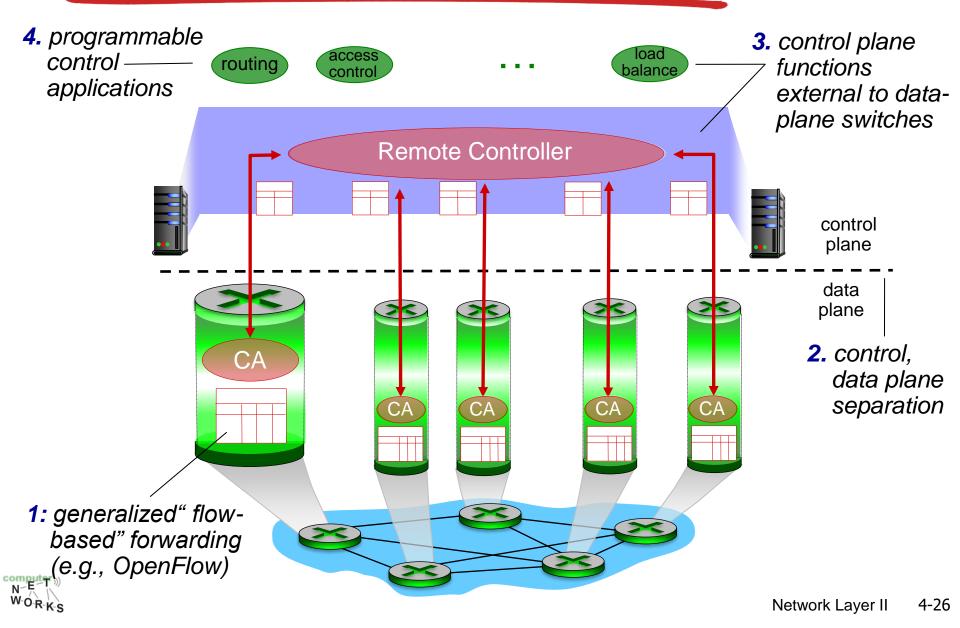

<u>Q</u>: what if w wants to route blue and red traffic differently?

<u>A:</u> can't do it (with destination based forwarding, and LS, DV routing)

#### Software defined networking (SDN)

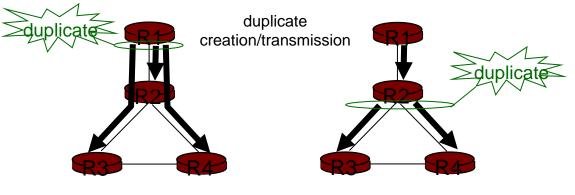

#### **Network Layer II**

- 4.5 Routing protocols
  - Routing Information Protocol (RIP)
  - Open Shortest Path First (OSPF)
  - Border Gateway Protocol (BGP)
- 4.6 Multicast
  - Broadcast routing
  - Multicast routing
  - Multicast routing protocols
- 4.7 Mobility
  - What is Mobility?
  - Network layer mobility concepts and principles
  - Mobile IP

#### **Broadcast Routing**

- Deliver packets from source to all other nodes
- Source duplication is inefficient:

source duplication in-network duplication

 Where does info come from? How to use in link state?

#### **In-network duplication**

- Flooding: when node receives broadcast packets, sends copy to all neighbors
  - Problems: cycles & broadcast storm
- Controlled flooding: node only broadcast pkt if it hasn't broadcasted same pkt before
  - Node keeps track of pkt ids already broadcasted
  - Reverse path forwarding (RPF): only forward pkt if it arrived on shortest path between node and source

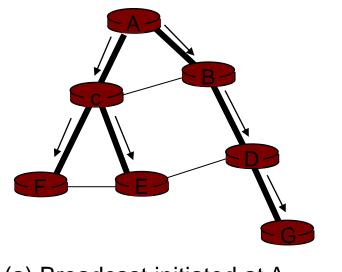

#### Spanning tree

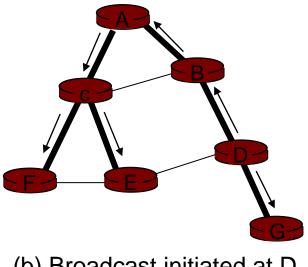

No redundant packets received by any node

#### **Spanning Tree**

- First construct a spanning tree
- Nodes forward copies only along spanning tree

(a) Broadcast initiated at A

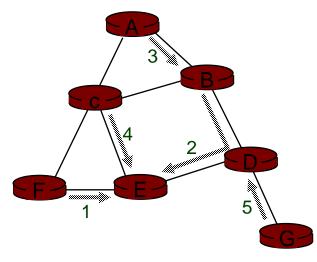

(b) Broadcast initiated at D

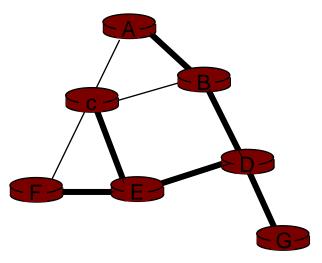

#### **Spanning Tree: Creation**

- Center node
- Each node sends unicast join message to center node 'E'
  - Message forwarded until it arrives at a node already belonging to spanning tree

(a) Stepwise construction of spanning tree

(b) Constructed spanning tree

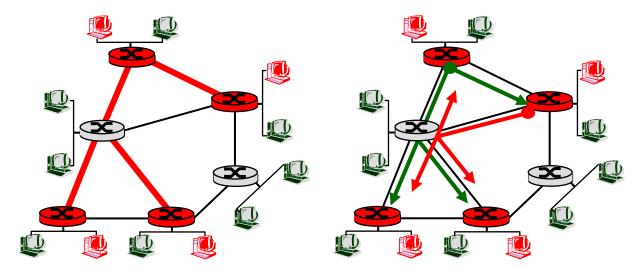

#### **Network Layer II**

- 4.5 Routing protocols
  - Routing Information Protocol (RIP)
  - Open Shortest Path First (OSPF)
  - Border Gateway Protocol (BGP)
- 4.6 Multicast
  - Broadcast routing
  - Multicast routing
  - Multicast routing protocols
- 4.7 Mobility
  - What is Mobility?
  - Network layer mobility concepts and principles
  - Mobile IP

#### Multicast Routing: Problem Statement

- Goal: find a tree (or trees) connecting routers that have local multicast group members
  - Tree: not all paths between routers used
  - Source-based: different tree from each sender to receiver
  - Shared-tree: same tree used by all group members

Source-based trees

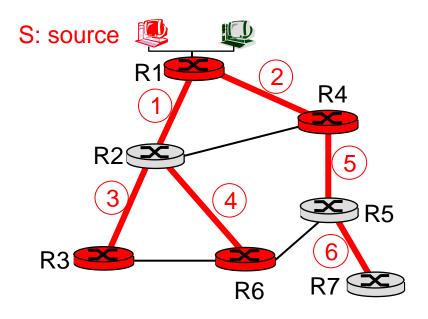

## Approaches for building mcast trees

- Source-based tree: one tree per source
  - shortest path trees
  - reverse path forwarding
- Group-shared tree: group uses one tree
  - minimal spanning (Steiner)
  - center-based trees

#### **Shortest Path Tree**

- Multicast forwarding tree: tree of shortest path routes from source to all receivers
  - Dijkstra's algorithm

#### LEGEND

router with attached group member

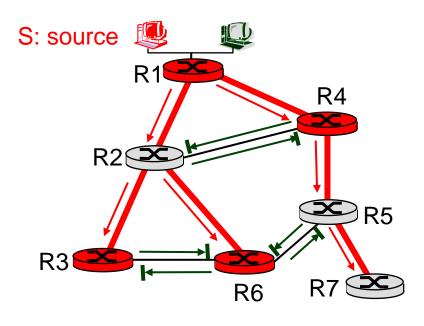

- router with no attached group member
- link used for forwarding,
   i indicates order link
   added by algorithm

#### **Reverse Path Forwarding**

- Relies on router's knowledge of unicast shortest path from it to sender
- Each router has simple forwarding behavior: if (multicast datagram received on incoming link on shortest path back to center) then flood datagram onto all outgoing links else ignore datagram

#### **Reverse Path Forwarding: example**

LEGEND

router with attached group member

router with no attached group member

datagram will be forwarded

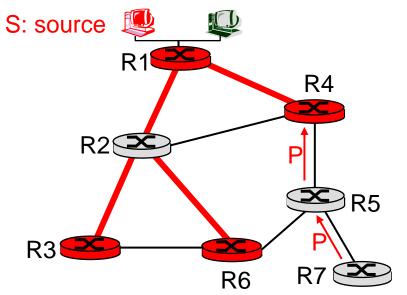

I datagram will not be forwarded

result is a source-specific *reverse* SPT
 – may be a bad choice with asymmetric links

## Reverse Path Forwarding: pruning

- forwarding tree contains subtrees with no multicast group members
  - no need to forward datagrams down subtree
  - "prune" msgs sent upstream by router with no downstream group members

#### LEGEND

- router with attached group member
- router with no attached group member
  - prune message
  - links with multicast forwarding

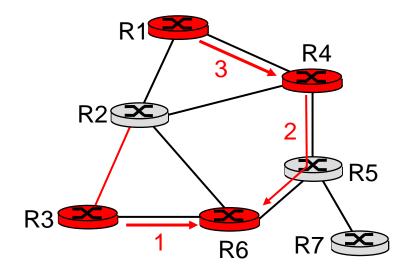

#### **Center-based trees**

- Single delivery tree shared by all
- One router identified as "center" of tree
- To join:
  - edge router sends unicast join-msg addressed to center router
  - join-msg "processed" by intermediate routers and forwarded towards center
  - join-msg either hits existing tree branch for this center, or arrives at center
  - path taken by join-msg becomes new branch of tree for this router

# Center-based trees: an example

#### Suppose R6 chosen as center:

#### LEGEND

- X
  - router with attached group member
- X
- router with no attached group member
  - path order in which join messages generated

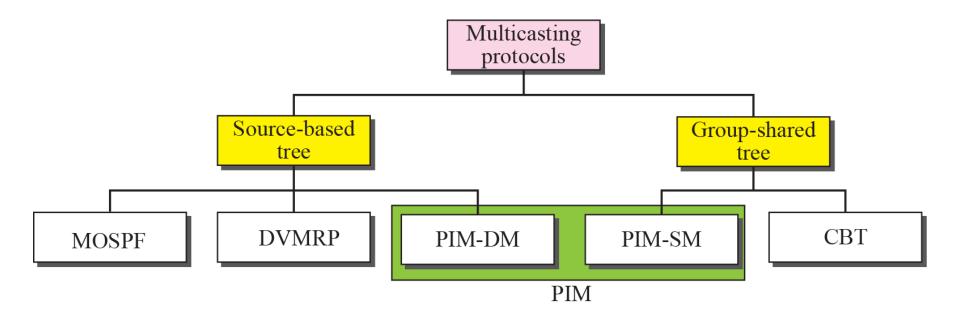

## **Network Layer II**

- 4.5 Routing protocols
  - Routing Information Protocol (RIP)

- 4.6 Multicast
  - Broadcast routing
  - Multicast routing
  - Multicast routing protocols
- 4.7 Mobility
  - What is Mobility?
  - Network layer mobility concepts and principles
  - Mobile IP

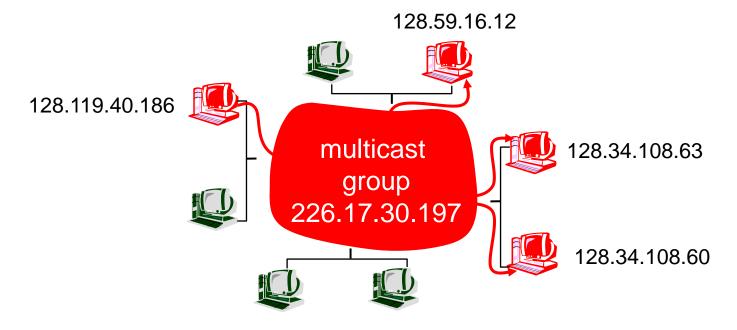

## **Multicast routing protocols**

## Internet Multicast Service Model

Multicast group concept: use of indirection

- hosts addresses IP datagram to multicast group
- routers forward multicast datagrams to hosts that have "joined" that multicast group

#### **Multicast Groups**

Class D Internet addresses reserved for multicast:

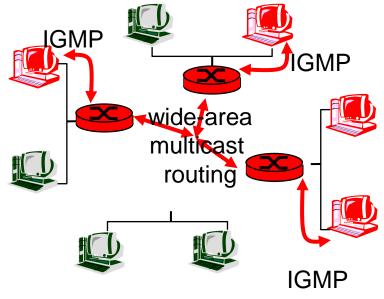

• Host group semantics:

- o anyone can "join" (receive pkts) multicast group
- anyone can send pkts to multicast group
- no network-layer identification to hosts of the members
- Needed: infrastructure to deliver mcast-addressed datagrams to all hosts that have joined that multicast group

## Joining a mcast group: twostep process

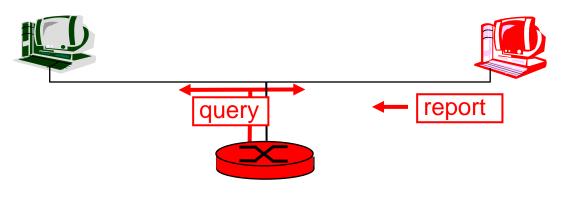

- Local: host informs local mcast router of a desire to join group:
  - IGMP (Internet Group Management Protocol)
- Wide area: local router interacts with other routers to receive mcast datagram flow
  - many protocols (e.g., DVMRP, MOSPF, PIM)

## IGMP: Internet Group Management Protocol

- Host: sends IGMP report when application joins mcast group
  - IP\_ADD\_MEMBERSHIP socket option
  - host needs not explicitly "disjoin" group when leaving
- Router: sends IGMP query at regular intervals
  - host belonging to a mcast group must reply to query

# Internet Multicasting Routing: DVMRP

- DVMRP: distance vector multicast routing protocol, RFC1075
- flood and prune: reverse path forwarding, source-based tree
  - RPF tree based on DVMRP's own routing tables constructed by communicating DVMRP routers
  - $_{\circ}~$  no assumptions about underlying unicast
  - initial datagram to mcast group flooded everywhere via RPF
  - routers not wanting group: send upstream prune msgs

#### **DVMRP: continued...**

- soft state: DVMRP router periodically (1 min.)
   "forgets" branches are pruned:
  - mcast data again flows down unpruned branch
  - downstream router: reprune or else continue to receive data
- routers can quickly regraft to tree

o following IGMP join at leaf

- $\circ$  odds and ends
  - commonly implemented in commercial routers
  - $_{\circ}~$  Mbone routing done using DVMRP

## PIM: Protocol Independent Multicast

- not dependent on any specific underlying unicast routing algorithm (works with all)
- two different multicast distribution scenarios :
   Dense:
  - group members densely packed, in "close" proximity.
  - bandwidth more plentiful
  - Sparse:
    - # networks with group members small wrt # interconnected networks
    - group members "widely dispersed"
    - bandwidth not plentiful

#### **Consequences of Sparse-Dense Dichotomy**

#### o Dense

- group membership
   by routers assumed
   until routers explicitly
   prune
- data-driven
   construction on
   mcast tree (e.g., RPF)
- bandwidth and nongroup-router
   processing profligate

#### Sparse

- no membership until routers explicitly join
- receiver- driven
   construction of mcast
   tree (e.g., center based)
- bandwidth and nongroup-router
   processing
   conservative

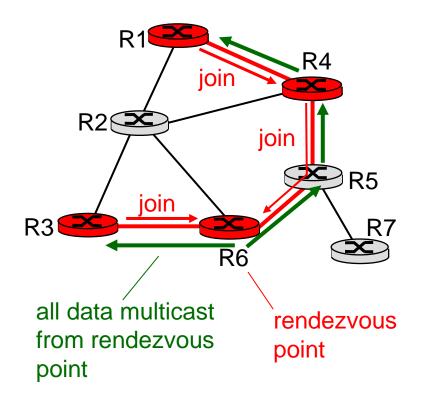

#### **PIM- Dense Mode**

- Flood-and-prune RPF, similar to DVMRP but
  - underlying unicast protocol provides RPF info for incoming datagram
  - less complicated (less efficient) downstream flood than DVMRP reduces reliance on underlying routing algorithm
  - has protocol mechanism for router to detect it is a leaf-node router

#### **PIM - Sparse Mode**

- center-based approach
- router sends *join* msg to rendezvous point (RP)
  - intermediate routers update state and forward *join*
- after joining via RP, router can switch to source-specific tree
  - increased performance: less concentration, shorter paths

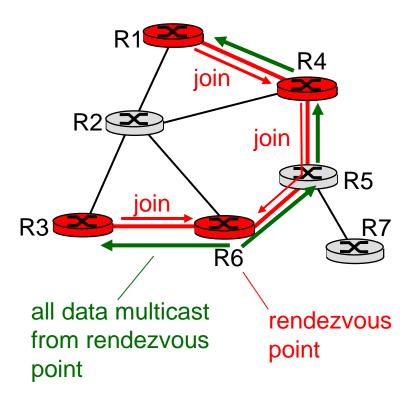

#### **PIM - Sparse Mode**

#### sender(s):

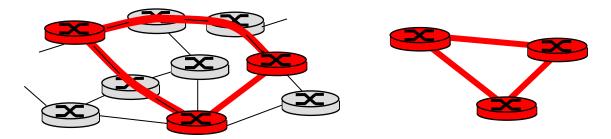

- unicast data to RP,
   which distributes down
   RP-rooted tree
- RP can extend mcast tree upstream to source
- RP can send stop msg if no attached receivers
  - "no one is listening!"

## Tunneling

 Q: How to connect "islands" of multicast routers in a "sea" of unicast routers?

physical topology

logical topology

- mcast datagram encapsulated inside "normal" (non-multicastaddressed) datagram
- normal IP datagram sent through "tunnel" via regular IP unicast to receiving mcast router
- o receiving mcast router de-capsulates pkt to get mcast datagram

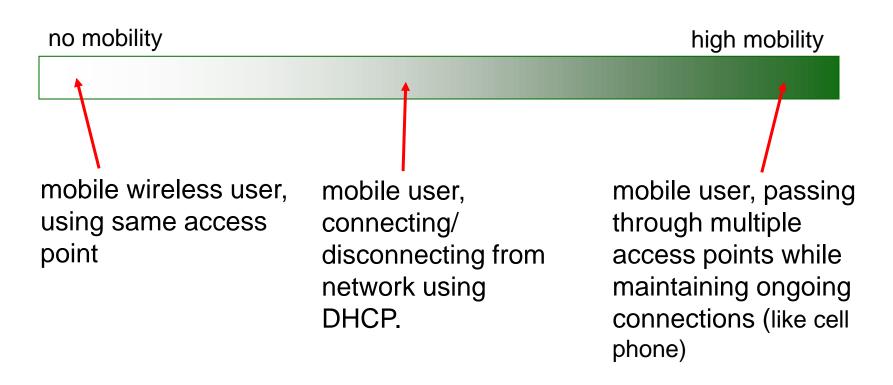

## **Network Layer II**

- 4.5 Routing protocols
  - Routing Information Protocol (RIP)
  - Open Shortest Path First (OSPF)
  - Border Gateway Protocol (BGP)
- 4.6 Multicast
  - Broadcast routing
  - Multicast routing
  - Multicast routing protocols
- o 4.7 Mobility
  - What is Mobility?
  - Network layer mobility concepts and principles
  - Mobile IP

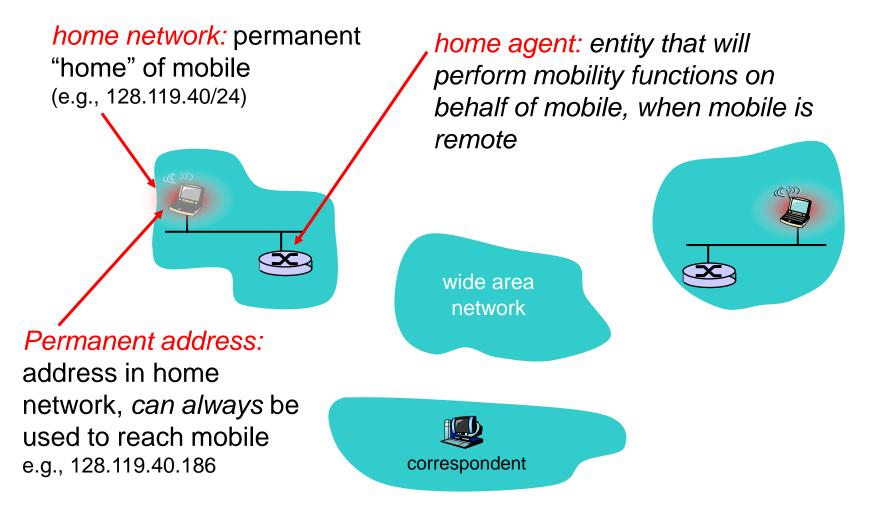

## What is mobility?

• spectrum of mobility, from the *network* perspective:

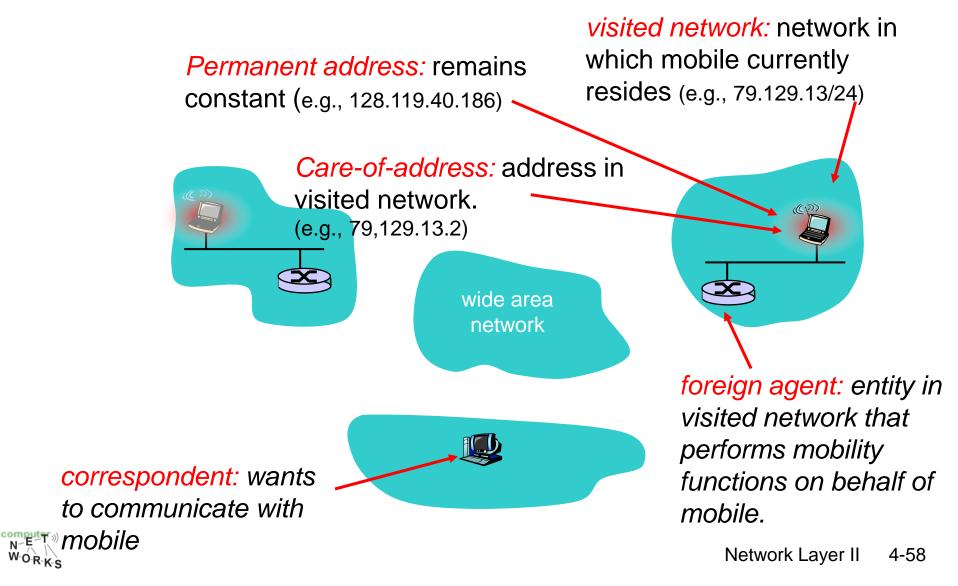

## **Mobility: Vocabulary**

#### Mobility: more vocabulary

#### How do you contact a mobile friend:

Consider friend frequently changing addresses, how do you find her?

- search all phone books?
- o call her parents?
- expect her to let you know where he/she is?

## **Network Layer II**

- 4.5 Routing protocols
  - Routing Information Protocol (RIP)
  - Open Shortest Path First (OSPF)
  - Border Gateway Protocol (BGP)
- 4.6 Multicast
  - Broadcast routing
  - Multicast routing
  - Multicast routing protocols
- 4.7 Mobility
  - What is Mobility?
  - Network layer mobility concepts and principles
  - Mobile IP

#### **Mobility: approaches**

- Let routing handle it
  - routers advertise permanent address of mobilenodes via usual routing table exchange.
  - routing tables indicate where each mobile located
  - $_{\circ}$  no changes to end-systems
  - o does not scale well!

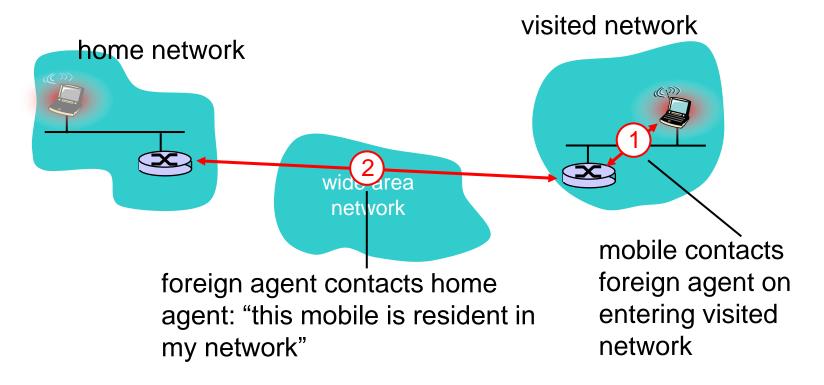

## **Mobility: approaches**

- Let end-systems handle it
  - Indirect routing: communication from correspondent to mobile goes through home agent, then forwarded to remote
  - Direct routing: correspondent gets foreign address of mobile, sends directly to mobile

#### **Mobility: registration**

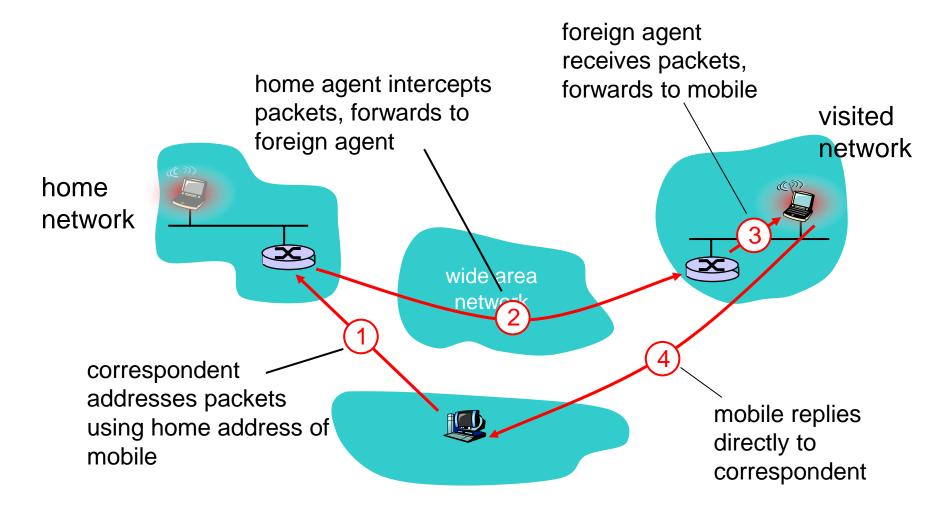

#### End result:

- Foreign agent knows about mobile
- Home agent knows location of mobile

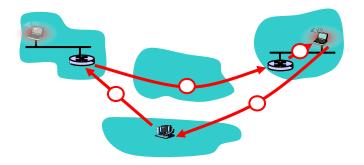

#### **Mobility via Indirect Routing**

#### **Indirect Routing: comments**

- Mobile uses two addresses:
  - permanent address: used by correspondent (hence mobile location is *transparent* to correspondent)
  - care-of-address: used by home agent to forward datagrams to mobile
- o foreign agent functions may be done by mobile itself
- triangle routing: correspondent-home-network-mobile
  - inefficient when
     correspondent, mobile
     are in same network

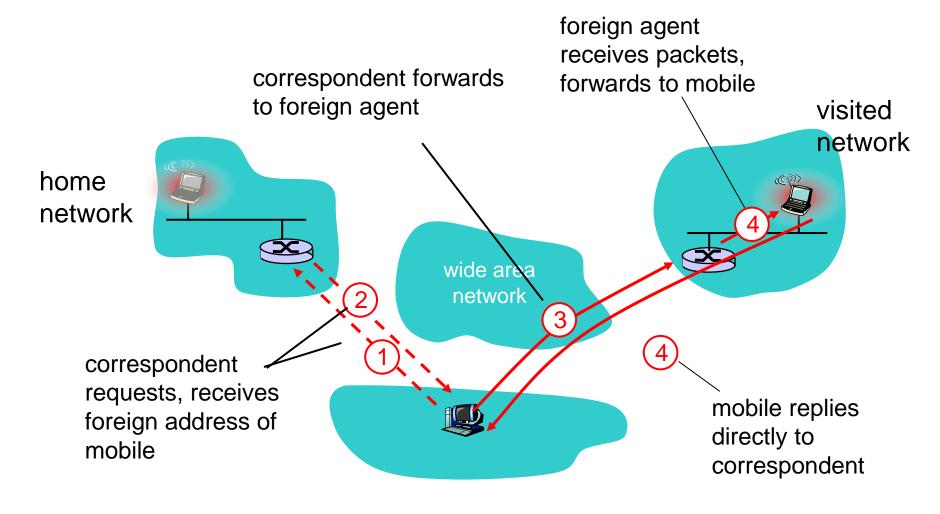

## Indirect Routing: moving between networks

- suppose mobile user moves to another network
  - registers with new foreign agent
  - new foreign agent registers with home agent
  - home agent update care-of-address for mobile
  - packets continue to be forwarded to mobile (but with new care-of-address)
- mobility, changing foreign networks transparent: ongoing connections can be maintained!

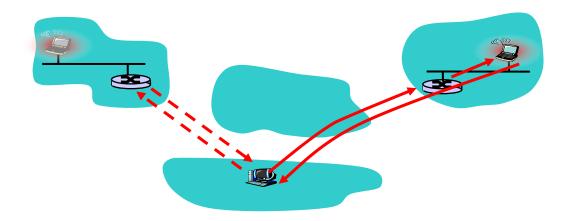

#### **Mobility via Direct Routing**

#### **Mobility via Direct Routing: comments**

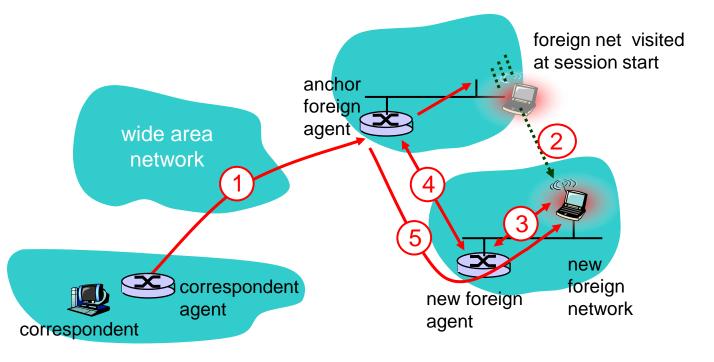

- overcome triangle routing problem
- non-transparent to correspondent: correspondent must get care-of-address from home agent
  - o what if mobile changes visited network?

## Accommodating mobility with direct routing

- anchor foreign agent: FA in first visited network
- data always routed first to anchor FA
- when mobile moves: new FA arranges to have data forwarded from old FA (chaining)

## **Network Layer II**

- 4.5 Routing protocols
  - Routing Information Protocol (RIP)
  - Open Shortest Path First (OSPF)
  - Border Gateway Protocol (BGP)
- 4.6 Multicast
  - Broadcast routing
  - Multicast routing
  - Multicast routing protocols
- 4.7 Mobility
  - What is Mobility?
  - Network layer mobility concepts and principles
  - Mobile IP

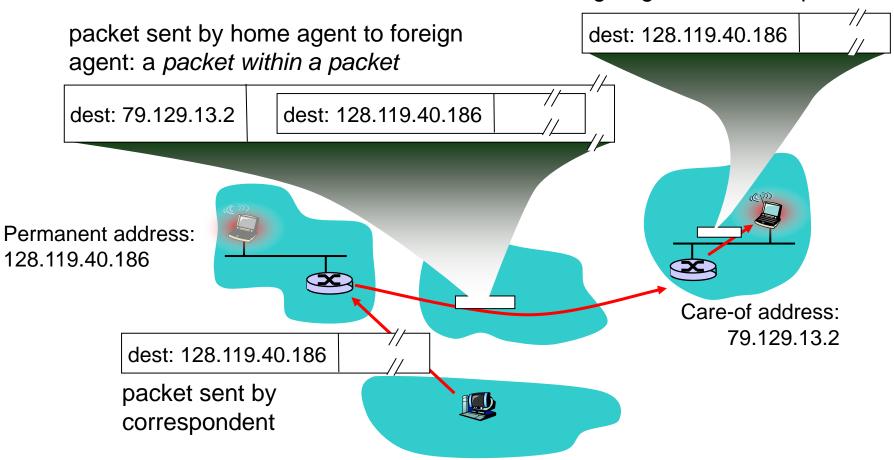

## Mobile IP

- RFC 3344
- has many features we've seen:
  - home agents, foreign agents, foreign-agent registration, care-of-addresses, encapsulation (packet-within-a-packet)
- three components to standard:
  - indirect routing of datagrams
  - agent discovery
  - registration with home agent

#### **Mobile IP: indirect routing**

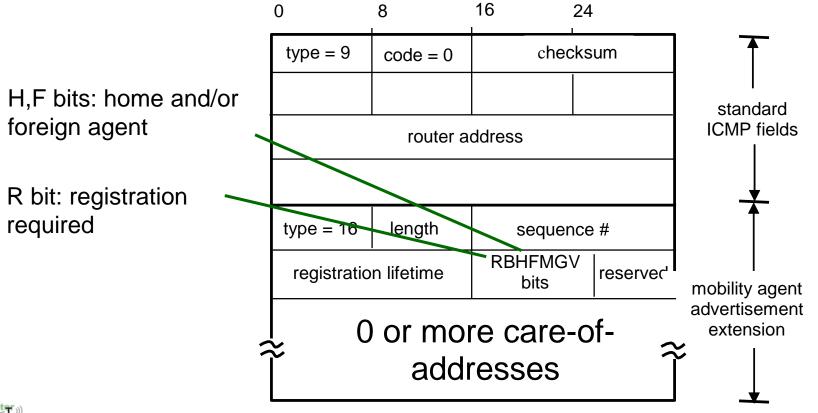

foreign-agent-to-mobile packet

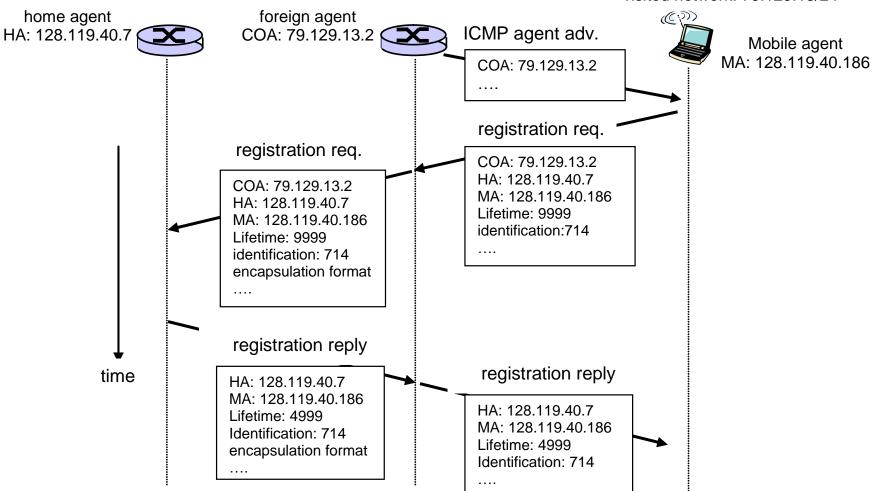

## Mobile IP: agent discovery

 agent advertisement: foreign/home agents advertise service by broadcasting ICMP messages (typefield = 9)

## Mobile IP: registration example

visited network: 79.129.13/24

#### Any questions?
